No.	Answer	Solution
9	**D**	Output power of pump $= \dfrac{\text{increae in gravitational potential enegy of water}}{\text{time taken}}$ ➔ $P = \dfrac{mgh}{t} = \dfrac{(1.3\times10^{9})(9.81)(2.0)}{24(3600)}$ = 295 Kw
10	**B**	The speed of the ball *v* is constant. From $\omega = \dfrac{v}{\ }$ → $\omega \propto \dfrac{1}{\ }$
