		$\frac{1}{2}m(9)v \quad 9$
7	**A**	To obey Hooke's Law, the given *F-x* graph should be linear. Work done, W = area under *F-x* graph (for linear part of the graph) i.e. $W = \frac{1}{2}Fx = \frac{1}{2}(28)(20 \times 10^{-3}) = 0.28$ J
8	**D**	Since the applied force F is a constant (= weight of object), and $W = Fs$, the
