

- 3 (a)** A *progressive wave* is a travelling disturbance, in which energy is propagated through a distance by a series of successive vibrations.
- (b) (i) 1.** The two sources must be coherent, meaning they must have a constant phase difference.

2. The two sources should produce waves with approximately the same amplitude.
3. The separation between the two sources should be greater than the wavelength of the wave so that the waves overlap.

Note: Do not reiterate what was given in the question such as the same frequency, wavelength or speed.

(ii) 1. Seven (excluding AS and CD).

2.
