

Answer B

- 22) At point P, there is destructive interference. When amplitude of S_2 is reduced, the waves from S_2 would not be able to have total cancellation (destructive interference) at point P with waves from S_1 . The waves at point P will be louder. At point Q, with the two waves having constructive interference, the resultant will be lower in amplitude as one of the waves have a lower amplitude.

Answer B

- 22) The electron gains KE and loses electric potential energy as it passes through D. to
