

Answer B

- 25) Answer this question by elimination. As I increases, the ratio of V over I decreases. This is similar to the characteristic of light dependent resistor and thermistor. However, light dependent resistor and thermistor have a non-linear relationship between I and V . Hence, for the graph shown, only the diode exhibit such relationship.

Answer A

- 26) $(\text{emf}) = IR_1 + Ir_1 \dots \dots \dots (1)$
