

Flux linkage = $N \times \text{magnetic flux} = 14.7 \times 10^3 \times 35 = 5.145 \times 10^5 \text{ Wb}$.

Answer B

- 31) Only for option A and B is there a flux passing through the area of the coil. This is where the orientation of the coil such that the flat surface area is perpendicular to the magnetic flux. However, there is greater magnetic flux through option A as the coil is placed nearer to the wire where there is a higher magnetic flux density.

Answer A
