

Thus the difference of the melting and boiling points of water is also 100 K.

18. Answer: C

A is not evident, as melting of X, Y and Z were not observed and recorded.

B is not true. As they were heated at the same rate over the same period of time, assuming no heat loss, they will thus gain the same amount of energy.

D is not evident, as none of the liquids were fully boiled to the gaseous state.

From $P = mc \frac{\Delta\theta}{t}$, since P and m is constant,

c is inversely proportional to $\frac{\Delta\theta}{t}$, gradient of the temperature - time graph.

Graph Y has the least gradient and thus highest c .

19. Answer: A
