

26. Answer: D

$$I = \frac{Q}{t}$$

$$t = \frac{\theta}{\omega} = \frac{2\pi}{4.1 \times 10^{16}} = 1.53 \times 10^{-16} \text{ s}$$

$$\therefore I = \frac{1.6 \times 10^{-19}}{1.53 \times 10^{-16}} = 1.0 \times 10^{-3} \text{ A}$$

27. Answer: D
