

Answer: B

- 32** When the magnet enters the coil, there is an increase in the magnetic flux linkage. An induced current flows in the coil to oppose the increase in magnetic flux linkage.

When the magnet leaves the coil, there is a decrease in the magnetic flux linkage. An induced current flows in the coil to oppose the decrease in magnetic flux linkage. The induced current in the coil when the magnet enters the coil and when the magnet leaves the coil is hence in the opposite direction..

Answer: D
