

2. Answer: B

Let the expression $R = \frac{xy^2}{z}$

$$\frac{\Delta R}{R} = \frac{\Delta x}{x} + 2\frac{\Delta y}{y} + \frac{\Delta z}{z}$$

$$\left(\frac{\Delta R}{R}\right)\% = \left(\frac{\Delta x}{x}\right)\% + \left(2\frac{\Delta y}{y}\right)\% + \left(\frac{\Delta z}{z}\right)\%$$

In order to obtain $\left(\frac{\Delta R}{R}\right)\% = 6\%$, the most suitable combination is $\left(\frac{\Delta x}{x}\right)\% = 2\%$,

$\left(2\frac{\Delta y}{y}\right)\% = 2 \times 1\% = 2\%$ and $\left(\frac{\Delta z}{z}\right)\% = 2\%$. Hence, the answer is B.
