

7. Answer: D

Option A: Constant. Acceleration due to free fall experienced by the golf ball in projectile motion is constant.

Option B: Constant. Horizontal component of velocity remains constant with air resistance negligible.

Option C: Constant. Rate of change of the vertical component of velocity is the acceleration due to free fall which is constant.

Option D: Not constant. According to the principle of conservation of energy, the ball's gain in gravitational potential energy as it gains height will be equal to the loss in its kinetic energy.
