

**25. Answer: A**

When the bar magnet begins to fall through the long coil of wire, the flux linkage through the long coil of wire increases, inducing an e.m.f. in it.

When the bar magnet falls out of the long coil of wire, the flux linkage through the long coil of wire decreases, inducing an e.m.f. in the opposite direction.

As the magnet accelerates under gravity, the rate of change increases. Hence the magnitude of the induced e.m.f. is larger when the magnet falls out of the long coil of wire.
