

$$= 5.0 \times 10^{-5} \text{ V}$$

26

C

Consider current in X flows in the clockwise direction, current in Y will flow in anti-clockwise direction. The directions of magnetic flux are as follows:

	O	P	Q
CW current in X	in	out	out
ACW current in Y	out	out	in
Mag of flux density	decreases	increases	decreases

27

B

$$V_p = \frac{M}{I_p} = \frac{M}{I_s} \cdot \frac{I_s}{I_p} = \frac{N_p}{N_s} \cdot \frac{V_s}{I_s} = \frac{N_p}{N_s} \cdot \frac{V_s}{I_s}$$
