

		temperature is higher at M than at L.
15	B	ΔU = increase in internal energy of system Q = heat supplied to system W = work done on system $\Delta U = Q + W$

No.	Answer	Solution
		In experiment 1, there is no work done since the gas is at constant volume. Hence $\Delta U = Q$. In experiment 2, the increase in internal energy $\Delta U = Q + W$ is lower than Q since the work done on the gas W is negative.
