

No.	Answer	Solution
6	C	Torque is a vector quantity, therefore the clockwise torque due to the horizontal forces is equal and opposite to the anticlockwise torque due to the vertical forces. The direction of the torque vector is determined from the Right-Hand Grip rule, where the fingers are curled around the axis of rotation, and the fingers representing the direction of the force. Hence, the thumb represents the direction of the torque vector. From this, we can determine that the direction of the torque due to the horizontal forces acts into the plane of the paper, while that due to the vertical forces acts out of the plane of the paper.
7	B	Torque = force $\times$ perpendicular distance between the forces
