

		remains unchanged.
15	C	The potential energy of the particle undergoing SHM is maximum at $t = 0$ and $t = 2$ s, indicating the particle is at the amplitude positions at these timings. At $t = 0$ and $t = 2$ s, the kinetic energy and hence the velocity of the particle is zero. The potential energy of the particle is zero at $t = 1$ s, indicating the particle is at the equilibrium position of the SHM. At $t = 1$ s, the kinetic energy and hence the velocity of the particle is maximum.
