

No.	Answer	Solution
24	A	The magnetic field in the circular coil is into the page, by right-hand grip rule. By Fleming's left-hand rule, the magnetic force acting on the short, straight wire due to the circular coil is upwards.  The diagram illustrates a circular coil with current I_1 flowing clockwise. A short, straight wire with current I_2 flows to the right through the center of the coil. The magnetic field due to the circular coil is represented by a circle with a cross ($\otimes$), indicating it is directed into the page. The magnetic force F_B acting on the straight wire is shown as a blue arrow pointing upwards.
