

No.	Solution
5	Nuclear fusion is the joining of two smaller nuclei to form a larger nucleus. The total mass of reactants is larger than the total mass of products. The difference in mass multiplied by the square of the speed of light is equal to the energy released during nuclear fusion. The binding energy of the product (the larger nucleus) is larger than the binding energy of the reactants (the two smaller nuclei).
6(a)	Magnetic flux density is defined as the force per unit length per unit current acting
