

		0.020 kg m
7	B	Height of pendulum after first two oscillations, $h_f = 0.60e^{-0.10 \times 2}$ $= 0.491 \text{ m}$ Work done against air resistance by pendulum in the first two oscillations = loss in GPE after two oscillations $= \text{GPE}_i - \text{GPE}_f = mg(h_i - h_f)$ $= 0.40 \times 9.81 \times (0.60 - 0.491)$ $= 0.428$ $\approx 0.43 \text{ J}$
8	C	Angular velocity is the rate of change of angular displacement
