

		current out of the page) by $\times$ is towards the right.
26	B	Option A: Incorrect By Fleming's Left-Hand Rule, the magnetic field must be perpendicular to the direction of the magnetic force F on the electron. Option B: Correct By Fleming's Left-Hand Rule, a magnetic field that is in a direction perpendicular to the velocity will cause the electron to experience a magnetic force F that is perpendicular to both the magnetic field and its direction of travel. The magnetic force becomes the centripetal force causing the electron to subsequently move in a circular motion. Option D: Incorrect The electric field must be parallel to the direction of the electric force F acting on the electron. Option D: Incorrect An electric field that is in the same direction as the velocity of the electron will cause the electron to experience a force F that is parallel to its direction of travel, not at right angles to its direction of travel.
27	B	Option A: Valid
