16	D	

Qn	Answer	Solution
		 Using $\sin \theta = \frac{\lambda}{b}$, since $D \gg b$, $\theta \approx \frac{\lambda}{b}$, Using small angle approximation, $L \approx D\theta \Rightarrow \theta \approx \frac{L}{D}$, Width of central maximum is $x = 2L$ Hence, $\frac{\lambda}{b} \approx \frac{x}{2D} \Rightarrow b \approx \frac{2\lambda D}{x} = \frac{2cD}{fx}$
17	A	Using $d \sin \theta = n\lambda$
