

		$= 500$
18	A	Using $x = \frac{\lambda D}{a} = \frac{\lambda vt}{a} + x_0$, where $D = vt$, v is the constant speed in which the screen moves away from the slit, t is time, x_0 is the initial fringe separation. Hence, x is linearly proportional to t. 
19	D	The proton is positively charged. Plate Y is at a higher potential than plate
