

		which is gravitational field strength.
9	C	Options A and D: Spacecraft could be in free fall after their rockets have been turned off, either on the way down (A) or on the way up (D). Option B: Spacecraft does not require any force from its rockets if the gravitational force acting on it is just sufficient to provide the centripetal force required to keep it in circular motion about the centre of the Earth. Option C: To continue moving in a straight line despite the Earth's gravitational force pulling it, the spacecraft needs an additional force acting radially away from the Earth. This additional force has to be always equal in magnitude and opposite in direction to the Earth's gravitational pull on the rocket.
10	A	For one molecule, elastic collision with the shaded wall results in a change
