

		Criterion.
19	C	Since both the wires are made of the same materials, the number density of charge carriers is the same for both wires. $I = nevA \Rightarrow v = \frac{I}{neA} \Rightarrow \frac{4I}{ne\pi d^2}$ The current flowing in the wires is the same, hence the drift velocity of the charge carriers in the smaller diameter wire is larger.
20	B
