

		$\Rightarrow$ current A_2 decreases.
23	C	If the negative ion were to move in a straight line passes through holes P and Q, no resultant force with a component non-parallel to the velocity should be acting on it. Electric force acting on the negative ion is into the plane.

Qn	Answer	Solution
		Magnetic force acting on the positive ion is on the plane in the downwards direction .
34	B	Magnetic force provides the centripetal force required for the particle to move
